COMPOSITIONS AND METHODS FOR PROMOTING  
NERVE REGENERATION

BACKGROUND OF THE INVENTION

5 Following traumatic or mechanically induced axonal degeneration in the peripheral nervous system, axonal regeneration ensues, resulting in functional recovery. However, the rate of axonal elongation (3-4 mm/day) is slow. Consequently, recovery is measured in  
10 weeks or months, depending upon the distance between the site of injury and the target tissue. Therapies that speed regeneration over long distances would be highly beneficial to patients and would significantly reduce health care costs.

15 The immunosuppressant drug FK506 (USAN tacrolimus; Prograf®) speeds functional recovery and axonal regeneration in the rat in a dose-dependent manner following a sciatic nerve crush lesion (Gold et al., *J. Neurosci.* 15:7505-7516, 1995; Gold et al., *Restor.  
20 Neurol. Neurosci.* 6:287-296, 1994). FK506 was shown to stimulate neuritic outgrowth in a rat pheochromocytoma cell line in a concentration-dependent manner (Lyons et al., *Proc. Natl. Acad. Sci. USA* 91:3191-3195, 1994).

Systemic administration of two synthetic FK506  
25 analogs that bind FKBP-12 but that do not inhibit calcineurin activity (and which are not immunosuppressants) increases the size of myelinated fibers (Steiner et al., *Nature Medicine* 3:1-8, 1997; Steiner et al., *Proc. Natl. Acad. Sci. USA* 94:2019-2024,  
30 1997). U.S. Patent No. 5,654,332 (Armistead et al.) discusses immunosuppressive FK506 analogs that bind FKBP12 and that are said to stimulate neurite outgrowth in the presence of NGF. It was stated that the neurotrophic activity of these FKBP12 binding compounds  
35 "is directly related to their affinity for FKBP12 and their ability to inhibit FKBP12 rotomase activity" (*id.* at col. 7, lines 47-50).

It has been reported that androgens and estrogens stimulate facial nerve regeneration in hamsters

(Jones, "Androgenic enhancement of motor neuron regeneration," In: Luine and Harding, eds., *Hormonal Restructuring of the Adult Brain*, Ann. N.Y. Acad. Sci. 85:141-164, 1994; Tanzer and Jones, *Exp. Neurol.* 146:258-5 264, 1997).

SUMMARY OF THE INVENTION

- I have discovered that geldanamycin and FK506 stimulate nerve regeneration via a common mechanism.
- 10 Both compounds bind to polypeptide components of steroid receptor complexes, hsp90 and FKBP52, respectively. These and other compounds that cause hsp90 dissociation from steroid receptor complexes or that block association of hsp90 with steroid receptor complexes stimulate nerve
- 15 cell growth and promote nerve regeneration. Such compounds can act directly by binding to hsp90 (as in the case of geldanamycin) or indirectly by binding to another polypeptide in the steroid receptor complex (as in the case of FK506 binding of FKBP52).
- 20 According to one aspect of the invention, pharmaceutical compositions are provided that include a nerve growth stimulating amount of a non-FKBP12-binding agent that binds to a polypeptide component of a steroid receptor complex other than the ligand (i.e., steroid
- 25 hormone) binding portion thereof (such polypeptide components including, but not limited to, hsp90 or FKBP52) and a pharmaceutically acceptable excipient. Without limitation to any particular mechanism of action, binding of such agents to the polypeptide component
- 30 likely causes hsp90 dissociation from the complex or prevents hsp90 association with the complex. Nerve growth promoting agents according to the invention include, but are not limited to non-FKBP12-binding FK506 analogs, benzoquinone ansamycins (e.g., geldanamycin and
- 35 derivatives thereof), peptides that comprise a sequence of a selected polypeptide component of the complex at a site of interaction between the selected component and another component of the complex, antibodies that bind a polypeptide component of the steroid receptor complex,

and combinations thereof.

According to another aspect of the invention, such pharmaceutical compositions include other active ingredients, including, but not limited to, neurotrophic factor other than the nerve growth promoting agent (e.g., NGF, IGF-1, aFGF, bFGF, PDGF, BDNF, CNTF, GDNF, NT-3, NT 4/5, or mixtures thereof), and a steroid ligand of the steroid receptor complex (e.g., estrogen and dexamethasone, as in the Examples below).

10 According to another aspect of the invention, a transection (severing of the nerve) of a peripheral nerve or a spinal cord injury of a mammal is treated by methods that include administering a nerve growth stimulating amount of a non-FKBP12-binding nerve growth promoting agent to the mammal and grafting to the peripheral nerve or spinal cord an allograft or an artificial nerve graft. In the case of a transected peripheral nerve or spinal cord, the space between the transected ends of the peripheral nerve or spinal cord is preferably filled with 15 a material such as collagen, methyl cellulose, etc., or a cell suspension that promotes nerve cell growth, such as Schwann cells and olfactory and sheathing cells. The nerve growth promoting agent can be included together with such filling materials.

20 25 According to another aspect of the invention, pharmaceutical compositions are provided that include a nerve growth stimulating amount of a non-FKBP12-binding FK506 analog that binds to FKBP52 and a pharmaceutically suitable excipient.

30 35 According to another aspect of the invention, pharmaceutical compositions are provided that include a nerve growth stimulating amount of an agent that binds to hsp90 and causes hsp90 dissociation from a steroid receptor complex or prevents hsp90 association with the complex and a pharmaceutically suitable excipient.

According to another aspect of the invention, methods of stimulating nerve cell growth in a mammal are provided that include administering a pharmaceutical composition as described herein.

According to another aspect of the invention, methods are provided for stimulating growth of a nerve cell that include contacting the nerve cell with a non-FKBP12-binding agent that binds to a polypeptide

5 component of a steroid receptor complex other than the steroid hormone binding portion thereof and causes hsp90 dissociation from the complex or blocks association of hsp90 with the complex.

According to another aspect of the invention, 10 methods of identifying compounds that stimulate nerve cell growth are provided that include the steps of assaying test compounds for binding to a component of a steroid receptor complex other than the steroid hormone binding portion thereof, and assaying the binding 15 compounds for stimulation of nerve cell growth. In addition, the binding compounds can be assayed for activity in dissociation of hsp90 from the complex or blocking association of hsp90 with the complex.

The foregoing and various features and advantages of 20 the invention will become more apparent from the following detailed description and accompanying drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 shows structures of FK506 (left) and a, 25 representative FK506 analog, V-10,367 (right). The bracketed portion of FK506 represents the calcineurin-binding domain, which is absent in V-10,367.

FIGS. 2-8 are histograms showing the stimulation of growth of SH-SY5Y cells by geldanamycin 30 and FK506 in the presence of NGF (10 ng/mL) 168 hours after treatment. FIG. 2: control cells (untreated). FIG. 3: NGF only (10 ng/mL). FIG. 4: geldanamycin (1 nM) + NGF (10 ng/mL). FIG. 5: geldanamycin (10 nM) + NGF (10 ng/mL). FIG. 6: FK506 (10 nM) + NGF (10 ng/mL). FIG. 7: 35 geldanamycin (1 nM) + FK506 (10 nM) + NGF (10 ng/mL). FIG. 8: geldanamycin (10 nM) + FK506 (10 nM) + NGF (10 ng/mL).

FIGS. 9-15 are histograms showing the stimulation of growth of SH-SY5Y cells by geldanamycin

and FK506 in the presence of NGF (10 ng/mL) 168 hours after treatment. FIG. 9: control cells (untreated). FIG. 10: NGF only (10 ng/mL). FIG. 11: FK506 (1 nM) + NGF (10 ng/mL). FIG. 12: FK506 (10 nM) + NGF (10 ng/mL). FIG. 13: geldanamycin (0.1 nM) + NGF (10 ng/mL). FIG. 14: geldanamycin (0.1 nM) + FK506 (1 nM) + NGF (10 ng/mL). FIG. 15: geldanamycin (0.1 nM) + FK506 (10 nM) + NGF (10 ng/mL).

10 DETAILED DESCRIPTION

Members of the steroid/thyroid receptor family, including steroid receptors such as the glucocorticoid and progesterone receptors, act as ligand-inducible enhancers of specific gene expression.

15 Upon translation, steroid receptors are assembled into multiprotein complexes. Steroid receptors exist in two states that are in dynamic equilibrium in the cell. An initial hormone receptor complex includes the steroid receptor, hsp90, hsp70, and at least two co-  
20 chaperones, p60 and Hip (p48). This initial complex is localized in the cytosol and does not bind DNA or enhance specific gene transcription. The initial complex is in equilibrium with a metastable, nearly mature complex that lacks hsp90, p60, and Hip but includes p23 and one of the  
25 three large immunophilins, FKBP52 (also called hsp56), FKBP54, or CyP40, and under some circumstances, hsp 70 (Smith et al., *Mol. Cell. Biol.* 15:6804-6812, 1995; Dittmar et al., *J. Biol. Chem.* 271:12833-12839, 1996). The nearly mature complex is competent to bind hormone;  
30 upon hormone binding, the receptor is released as an active transcription factor (Smith et al., *Mol. Cell. Biol.* 15:6804-6812, 1995; Dittmar et al., *J. Biol. Chem.* 271:12833-12839, 1996). Steroid receptor complexes are constantly dissociating and reforming under physiological  
35 conditions.

Hsp90-mediated conformational maturation is required for nuclear hormone receptors to acquire or maintain a state competent to bind hormone (Smith et al., *Mol. Cell. Biol.* 15:6804-6812, 1995; Dittmar et al., *J.*

Biol. Chem. 271:12833-12839, 1996). Geldanamycin, a benzoquinone ansamycin antibiotic, binds in a pharmacologically specific manner to hsp90 (Whitesell et al., Proc. Natl. Acad. Sci. USA 91:8324-8328, 1994) and 5 prevents association of the p23 component of the heterocomplex assembly system with hsp90 (Johnson and Toft, Mol. Endocrinol. 9:670-678, 1995). Geldanamycin permits dissociation of a steroid receptor complex, permitting receptors to be transformed (*i.e.*, dissociated 10 from hsp90), but blocks reassembly of the hormone-responsive form of the complex, thereby preventing hormone activation and ultimately resulting in the degradation of the hormone receptor. Geldanamycin blocks assembly of the progesterone receptor (PR) complex (Smith, 15 et al., Mol. Cell. Biol. 15:6804-6812, 1995) and of the glucocorticoid receptor (GR) complex (Czar et al., Biochem. 36:7776-7785, 1997) at an intermediate stage of assembly where the hormone binding domain is not properly folded and therefore cannot bind steroid. Geldanamycin 20 also is known to act on estrogen and androgen hormone receptors (Smith et al., Mol. Cell. Biol. 15:6804-6812, 1995; Nair et al., Cell Stress and Chaperones 1:237-250, 1996). Transformation of GR and PR as measured either by 25 9S to 4S conversion or by acquisition of DNA-binding activity is correlated with dissociation of steroid receptors from hsp90 (see, *e.g.*, Meshinchi et al., J. Biol. Chem. 265:4863-4870, 1990; Kost et al., Mol. Cell. Biol. 9:3829-3838, 1989).

In addition to steroid receptors, other 30 "substrate proteins" for hsp90 include v-erbA, dioxin receptor, sim, myoD1, E12, heat shock factor, tumor promoter-specific binding protein, hepatitis B reverse transcriptase, p53 tumor suppressor mutant, various protein kinases (*e.g.*, the tyrosine kinases v-src, c-src, 35 v-fps, v-yes, v-fes, v-frg, c-frg, lck, Wee1 kinase, and sevenless PTK), heme-regulated eIF-2 $\alpha$ , eEF-2 kinase, casein kinase II, v-raf, c-raf, Gag-Mil, MEK, PI-4 kinase, actin, tubulin, centrin, proteasome, and G<sub>s</sub>, complex (reviewed in Pratt and Toft, Endocrine Rev.

18:306-360, 1997).

FKBP52 is a member of the FK506-binding class of immunophilins. Binding of FK506 to GR-associated FKBP52 caused increased nuclear translocation of GR in response to dexamethasone and potentiation of GR-mediated gene expression (Sanchez and Ning, *METHODS: A Companion to Meth. Enzymol.* 9:188-200, 1996). Dexamethasone-induced GR-specific gene expression is also potentiated by cyclosporin A (CsA) (Renoir et al., *Proc. Natl. Acad. Sci. USA* 92:4977-4981, 1995), rapamycin (Ning and Sanchez, *J. Biol. Chem.* 268:6073-6076, 1993), and nonimmunosuppressive analogs of FK506 (e.g., 15-o-desmethyl FK520) or of CsA (e.g., CsH and SDZ220384) (Sanchez and Ning, *METHODS: A Companion to Meth. Enzymol.* 9:188-200, 1996).

CyP40, rather than FKBP52, is the target for binding of CsA and its analogs (Sanchez and Ning, *METHODS: A Companion to Meth. Enzymol.* 9:188-200, 1996). FKBP52 and CyP40 bind directly to hsp90, and CyP40 competes for FKBP52 binding to hsp90 and vice versa. The immunophilins bind hsp90 in a mutually exclusive fashion, leading to the formation of separate CyP40-hsp90 and FKBP52-hsp90 complexes (Ratajczak and Carrelo, *J. Biol. Chem.* 271:2961-2965, 1996). Immunophilins such as FKBP52 and CyP40 and non-immunophilin proteins such as PPS, p60, and Mas70p, have one or more tetratricopeptide repeat (TPR) domains (Ratajczak et al., *J. Biol. Chem.* 268:13187-13192, 1993) that bind to the TPR-binding domain of hsp90. The number of TPR domains in a protein appears to correlate with its hsp90-binding affinity. Regions bordering the TPR domain also participate in binding, e.g., the acidic domain at the N-terminal end of bovine CyP40 (residues 185-225) and FKBP52 (residues 232-271) and the calmodulin binding region at the C-terminus of bovine CyP40 (Ratajczak and Carrelo, *J. Biol. Chem.* 271:2961-2965, 1996). Binding of both FKBP52 and CyP40 to hsp90 is competed by a purified fragment of human CyP40 comprising its three TPR domains and by a fragment of rat PPS comprising its four TPR domains (reviewed in

Pratt and Toft, *Endocrine Rev.* 18:306-360, 1997).

In addition to multiple TPR binding domains, FKBP52 contains a sequence (EDLTDDED in rabbit) that is retained with conservative replacements in human and mouse. This negatively charged sequence is electrostatically complementary to the receptor nuclear localization signals (e.g., the NL1 sequence RKTKKKIK of rat GR). An antibody raised against the conserved negatively charged sequence impeded the dexamethasone-mediated shift of the GR into the nucleus (reviewed in Pratt and Toft, *Endocrine Rev.* 18:306-360, 1997). It has also been reported that antibodies directed against a conserved negatively-charged sequence of FKBP52 impede dexamethasone-mediated cytophamic-nuclear translocation of GR (Czar et al., *Mol. Endocrinol.* 9:1549-1560, 1995).

The effects of FK506 and geldanamycin on nerve regeneration likely result from the binding of these compounds to components of steroid receptor complexes, causing the dissociation of hsp90 from the steroid receptor complex either directly (by binding to hsp90 or interfering with the binding of hsp90 to the steroid receptor) or indirectly (by binding to a polypeptide such as FKBP52 that itself binds to hsp90), or, alternatively, by preventing association of hsp90 with the steroid receptor complex. However, interference with the ability of hsp90 to complex with and perform its chaperone function for other hsp90 substrate proteins may also be responsible for or contribute to the observed stimulation of nerve regeneration by FK506 and/or geldanamycin.

30

#### Definitions and Methods

"Nerve growth promoting agent" (NGPA). A "nerve growth promoting agent" or NGPA is defined as a substance that binds to a polypeptide component of a steroid receptor complex other than the steroid hormone binding portion thereof, such components including but not limited to hsp90 and FKBP52, and promotes nerve regeneration, without limitation to a particular mechanism of action. Preferably, the NGPA does not bind

S

FKBP12 and is non-immunosuppressive. NGPAs include, but are not limited to, non-FKBP12-binding ("non-binding") analogs of FK506; benzoquinone ansamycins, including geldanamycin, naturally occurring analogs of  
5 geldanamycin, including, but not limited to, herbimycin A and macbecin (DeBoer et al., J. Antibiot. (Tokyo) 23:442-447, 1970; Omura et al., J. Antibiot. (Tokyo) 32:255-261, 1979; Ono et al., Gann. 73:938-944, 1992), and derivatives thereof; peptides including an amino acid  
10 sequence of a particular polypeptide component of a steroid receptor complex at a site of interaction between that component and another component of the complex (such as the TPR domain), and antibodies that bind specifically to polypeptide components of steroid receptor complexes,  
15 e.g., anti-hsp90, anti-FKBP52, etc.) and interfere with the interaction of the bound polypeptide with another polypeptide in the steroid receptor complex.

"Steroid receptor complex" or "steroid hormone receptor" and "component" thereof; "transformation"; "activation". The term "steroid receptor complex" is intended to encompass a multiprotein complex associated with any steroid receptor, including, but not limited to, the progesterone receptor, glucocorticoid receptor, estrogen receptor, androgen receptor, and  
25 mineralocorticoid receptor. A polypeptide "component" is a polypeptide other than the steroid hormone binding portion of the steroid receptor complex, and preferably other than steroid receptor (particularly the steroid hormone binding portion thereof), such as hsp90, FKBP52, etc., that is part of a steroid receptor complex.

The term "transformation" refers to the conversion of the 9S non-DNA-binding form of a steroid receptor complex to the 4S DNA-binding form. The term "activation" refers to the conversion of a steroid receptor from a form that does not bind steroid to a steroid-binding form.

Assays for Identifying NGPAs. There are a number of well-known methods for assaying compounds that bind to hsp90, FKBP52, and other polypeptide components

of a steroid receptor complex that can be used as an initial screen for candidate compounds that stimulate nerve regeneration. Compounds can subsequently be tested in vitro or in vivo for activity in stimulating nerve

5 regeneration.

For example, one may assay for the binding of a test compound to a polypeptide that is a component of a steroid receptor complex. An assay for binding to hsp90 is described, for example, by Whitesell et al. (Proc.

10 Natl. Acad. Sci. USA 91:8324-8328, 1994). Commercial hsp90 (StressGen Biotechnologies, Victoria, BC) dissolved in 20 µg/mL of TNESV buffer (50 mM Tris-HCl, pH 7.4/1% Nonidet P-40/2 mM EDTA/100 mM NaCl/1 mM orthovanadate/1 mM phenylmethylsulfonyl fluoride/20 µg leupeptin per

15 mL/20 µg of aprotinin per ml) and the test compound are incubated for 45 min at 4°C with geldanamycin immobilized on a conventional solid support, e.g., geldanamycin-coupled agarose beads (Whitesell et al., Proc. Natl. Acad. Sci. USA 91:8324-8328, 1994. The beads are then

20 washed with TNESV buffer and bound hsp90 is eluted by heating in reducing loading buffer and can be analyzed by SDS/PAGE and silver staining (Bio-Rad), for example. Alternatively, if the hsp90 is labeled, one can assay for bound label versus free label. Test compounds that

25 compete with geldanamycin for binding to hsp90 inhibit the binding of solubilized hsp90 to the beads.

Similar assays can be performed to identify compounds that bind other steroid receptor complex polypeptide components. Binding to FKBP52 can be assayed 30 using recombinant FKBP52 (Peattie et al., Proc. Natl. Acad. Sci. USA 89:10974-10978, 1992) instead of hsp90 and immobilized FK506 or FK506 analogs or hsp90. Binding to p23 can be assayed using recombinant human p23 (Johnson et al., Mol. Cell. Biol. 14:1956-1963, 1994) and

35 immobilized hsp90. Purified hsp70 and recombinant p60 (Dittmar et al., J. Biol. Chem. 271:12833-12839, 1996) are also available for use in such binding assays.

Immunoassays can also be performed using conventional immunoassay methodologies and antibodies

- that are specific for steroid receptor complex components, e.g., antibodies against FKBP52 (Tai et al., *Biochem.* 25:5269-5275, 1986), hsp90 (Sanchez et al., *J. Biol. Chem.* 260:12398-12401, 1985; Catelli et al., *EMBO J.* 4:3131-3135, 1985; Schuh et al., *J. Biol. Chem.* 260:14292-14296, 1985), hsp70 (a serum that also recognizes hsp90 (Erhart et al., *Oncogene* 3:595-603, 1988), p23 (Johnson et al., *Mol. Cell. Biol.* 14:1956-1963, 1994), etc.
- 10           A well-accepted qualitative assay for receptor transformation, which involves dissociation of hsp90 from the receptor complex, is conversion of a receptor complex to a state that binds polyanions such as phosphocellulose (Kalimi et al., *J. Biol. Chem.* 250:1080-1086, 1975; Atger 15 and Milgrom, *Biochem.* 15:4298-4304, 1976), ATP-Sepharose (Toft et al., *J. Steroid Biochem.* 7:1053-1059, 1976; Miller and Toft, *Biochem.* 17:173-177, 1978), and carboxymethol-Sephadex (Milgrom et al., *Biochem.* 12:5198-5205, 1973; Parchman and Litwack, *Arch. Biochem. Biophys.* 20 183:374-382, 1977).
- 15           An *in vitro* assay for nerve cell growth (neurite outgrowth) is provided in Example 1 below. *In vivo* assays for nerve regeneration are discussed in, for example, Gold et al., *Restor. Neurol. Neurosci.* 6:287-296, 1994; Gold et al., *J. Neurosci.* 15:7505-7516, 1995; Wang et al., *J. Pharmacol. Exp. Therapeutics* 282:1084-1093, 1997; Gold et al., *Exp. Neurol.* 147:269-278, 1997; Gold et al., *Soc. Neurosci. Abst.* 23:1131, 1997, which examine the effects of systematic administration of a 20 test compound on nerve regeneration and functional recovery following a crush injury to the rat sciatic nerve. Briefly stated, the right sciatic nerve of anaesthetized rats is exposed, and the nerve crushed twice using forceps at the level of the hip. Following 25 the sciatic nerve crush, the test compound is administered to the rats, e.g., by subcutaneous injection or oral administration. Functional recovery is assessed by determining the number of days following nerve crush until the animal demonstrates onset of an ability to

right its foot and move its toes, and the number of days until the animal demonstrates an ability to walk on its hind feet and toes. Nerve regeneration is also assessed by sampling tissues from the sciatic nerve at known (0.5 cm) distances from the crush site and examining the number of myelinated fibers and the size of axons by light microscopy. The axons are also examined by electron microscopy. Axonal areas of both myelinated and unmyelinated fibers are determined by tracing the axolemma using a digitizing tablet connected to a computer with appropriate software. Cumulative histograms are constructed from these data and mean values and standard errors are calculated to assess the effect of administration of the test compound on axonal areas.

"Geldanamycin derivatives". "Geldanamycin derivatives" include well-known synthetic derivatives (Schnur et al., *J. Med. Chem.* 38:3813-3820, 1995; Schnur et al., *J. Med. Chem.* 38:3806-3812, 1995). Geldanamycin derivatives preferably have the carbamate group and ansa ring of geldanamycin, which are necessary for activity (Schur et al., *J. Med. Chem.* 38:3806-3812, 1995), including modifications at the C23 methoxy and C22 methyl groups (Stebbins et al., *Cell* 89:239-250, 1997).

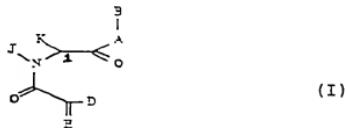

Geldanamycin derivatives are also discussed in U.S. Patent No. 5,3877,584, 4,261,989, and 3,987,035, and in Japanese Patent Applications 88041885, 56100766, and 89002593, for example.

"FK506 analogs". As used herein, the term "FK506 analogs" refers to compounds that are functionally analogous to FK506 in their ability to stimulate neuritic outgrowth. Such FK506 analogs, such as V-10,367, retain the FKBP12 binding domain but lack the structural components of the effector domain (FIG. 1) and may either bind FKBP12 or be non-binding. V-10,367, for example, binds FKBP12 with high affinity (< 1 nM) (Armistead et al., *Acta Crystallogr.* 51:522-528, 1995).

There has been an intense effort to design compounds that are structurally related to FK506 and that

share the ability of FK506 to inhibit FKBP12 and thereby cause immunosuppression. See, for example: Bierer et al., *Science* 250:556-559, 1990; Van Duyne et al., *Science* 252:839-842, 1991; Van Duyne et al., *J. Mol. Biol.*

- 5 229:105-124, 1993; Hauske et al., *J. Med. Chem.* 35:4284-4296, 1992; Holt et al., *J. Am. Chem. Soc.* 115:9925-9938, 1993; Holt et al., *Bioorg. Med. Chem. Lett.* 3:1977-1980, 1993; Teague and Stocks, *Bioorg. Med. Chem. Lett.* 3:1947-1950, 1993; Wang et al., *Bioorg. Med. Chem. Lett.* 4:1161-1166, 1994; Yamashita et al., *Bioorg. Med. Chem. Lett.* 4:325-328, 1994; Stocks et al., *Bioorg. Med. Chem. Lett.* 4:1457-1460, 1994; Goulet et al., *Perspect. Drug Disc. Design* 2:145-162, 1994; Wilson et al., *Acta Cryst. D51:522-528*, 1995; U.S. Patents No. 5,192,773, 5,330,993, 5,516,797, 5,612,350, 5,614,547, 5,622,970, 5,654,332; and published international patent applications WO 92/00278, WO 92/04370, WO 92/19593, WO 92/21313, WO 94/07858, and WO 96/40633.
- 10 20 FK506 analogs include, but are not limited to:
- (1) Compounds represented by the formula I  
(see U.S. Patents No. 5,622,970, 5,516,797, 5,330,993, 5,192,773, and WO 92/00278 regarding synthesis of these compounds, the disclosures of which are incorporated 25 herein by reference):

wherein A is O, NH, or N-(C1-C4 alkyl);

wherein B is hydrogen, CHL-Ar, (C1-C6)-straight or branched alkyl, (C2-C6)-straight or branched alkenyl, (C5-C7)-cycloalkyl, (C5-C7)-cycloalkenyl or Ar

35 substituted (C1-C6)-alkyl or (C2-C6)-alkenyl, or

wherein L and Q are independently hydrogen, (C<sub>1</sub>-C<sub>6</sub>)-straight or branched alkyl or (C<sub>2</sub>-C<sub>6</sub>)-straight or branched alkenyl;

wherein T is Ar or substituted cyclohexyl with  
5 substituents at positions 3 and 4 that are independently selected from the group consisting of hydrogen, hydroxyl, O-(C<sub>1</sub>-C<sub>4</sub>)-alkyl or O-(C<sub>2</sub>-C<sub>4</sub>)-alkenyl and carbonyl;

wherein Ar is selected from the group  
consisting of 1-naphthyl, 2-naphthyl, 2-furyl, 3-furyl,  
10 2-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl and phenyl having one to three substituents that are independently selected from the group consisting of hydrogen, halo, hydroxyl, nitro, CF<sub>3</sub>, (C<sub>1</sub>-C<sub>6</sub>)-straight or branched alkyl or (C<sub>2</sub>-C<sub>6</sub>)-straight or branched alkenyl, O-(C<sub>1</sub>-C<sub>4</sub>)-  
15 straight or branched alkyl or O-(C<sub>2</sub>-C<sub>4</sub>)-straight or branched alkenyl, O-benzyl, O-phenyl, amino and phenyl;  
provided that if D is hydrogen, then E is CH-U or if E is oxygen, then D is not hydrogen;

20 wherein each U is independently selected from hydrogen, O-(C<sub>1</sub>-C<sub>4</sub>)-straight or branched alkyl or O-(C<sub>2</sub>-C<sub>4</sub>)-straight or branched alkenyl, (C<sub>1</sub>-C<sub>6</sub>)-straight or branched alkyl or (C<sub>2</sub>-C<sub>6</sub>)-straight or branched alkenyl, (C<sub>5</sub>-C<sub>7</sub>)-cycloalkyl or (C<sub>5</sub>-C<sub>7</sub>)-cycloalkenyl substituted  
25 with (C<sub>1</sub>-C<sub>4</sub>)-straight or branched alkyl or (C<sub>2</sub>-C<sub>4</sub>)-straight or branched alkenyl, 2-indolyl, 3-indolyl, [(C<sub>1</sub>-C<sub>4</sub>)-alkyl or (C<sub>2</sub>-C<sub>4</sub>)-alkenyl]-Ar or Ar;

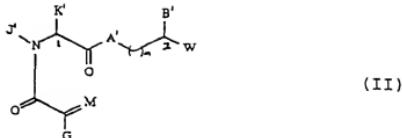

wherein J is hydrogen or C<sub>1</sub> or C<sub>2</sub> alkyl or benzyl; K is (C<sub>1</sub>-C<sub>4</sub>)-straight or branched alkyl, benzyl  
30 or cyclohexylmethyl; or wherein J and K may be taken together to form a 5-7 membered heterocyclic ring that may contain an oxygen (O), sulfur (S), SO or SO<sub>2</sub> substituent therein; and

the stereochemistry at position 1 is R or S.

35

(2) Compounds represented by the formula II  
(see U.S. Patent No. 5,654,332, WO 94/07858, and WO  
92/19593 for synthesis of these compounds, the disclosures of which are incorporated herein by

reference):

5

wherein A' is CH<sub>2</sub>, oxygen, NH, or N-(C1-C4 alkyl);

- wherein B' and W are independently hydrogen,  
10 Ar', (C1-C10)-straight or branched alkyl, (C2-C10)- straight or branched alkenyl or alkynyl, (C5-C7)- cycloalkyl substituted (C1-C6)-straight or branched alkyl, (C2-C6)-straight or branched alkenyl or alkynyl, (C5-C7)-cycloalkenyl substituted (C1-C6)-straight or  
15 branched alkyl, (C2-C6)-straight or branched alkenyl or alkynyl, or Ar' substituted (C1-C6)-straight or branched alkyl, (C2-C6)-straight or branched alkenyl or alkynyl wherein in each case, any one of the CH<sub>2</sub> groups of the alkyl, alkenyl, or alkynyl chains may be optionally replaced by a heteroatom selected from the group  
20 consisting of O, S, SO, SO<sub>2</sub>, N, and NR, wherein R is selected from the group consisting of hydrogen, (C1-C4)- straight or branched alkyl, (C2-C4)-straight or branched alkenyl or alkynyl, and (C1-C4) bridging alkyl wherein a.  
25 bridge is formed between the nitrogen and a carbon atom of the heteroatom-containing chain to form a ring, and wherein the ring is optionally fused to an Ar' group, or

30

wherein Q' is hydrogen, (C1-C6)-straight or

branched alkyl or (C2-C6)-straight or branched alkenyl or alkynyl;

- 35 wherein T' is Ar or substituted 5-7 membered cycloalkyl with substituents at positions 3 and 4 that are independently selected from the group consisting of oxo, hydrogen, hydroxyl, O-(C1-C4)-alkyl, and O-(C2-C4)- alkenyl;

wherein Ar' is a carboxyclic aromatic group selected from the group consisting of phenyl, 1-naphthyl, 2-naphthyl, indenyl, azulenyl, fluorenyl, and anthracenyl; or a heterocyclic aromatic group selected

5 from the group consisting of 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, pyrrolyl, oxazolyl, thiazolyl, imidazolyl, pyrazolyl, isoxazolyl, isothiazolyl, 1,2,3-oxadiazolyl, 1,2,3-triazolyl, 1,3,4-thiadiazolyl, pyridazinyl, pyrimidinyl, pyrazinyl, 1,3,5-

10 triazinyl, 1,3,5-trithianyl, indolizinyl, indolyl, isoindolyl, 3H-indolyl, indolinyl, benzo[b]furanyl, benzo[b]thiophenyl, 1H-indazolyl, benzimidazolyl, benzthiazolyl, purinyl, 4H-quinolizinyl, quinolinyl, isoquinolinyl, cinnolinyl, phthalazinyl, quinazolinyl,

15 quinoxalinyl, 1,8-naphthyridinyl, pteridinyl, carbazolyl, acridinyl, phenazinyl, phenothiazinyl, and phenoazinyl;

wherein Ar' may contain one to three substituents that are independently selected from the group consisting of hydrogen, halogen, hydroxyl,

20 hydroxymethyl, nitro, trifluoromethyl, trifluoromethoxy, (C<sub>1</sub>-C<sub>6</sub>)-straight or branched alkyl, (C<sub>2</sub>-C<sub>6</sub>)-straight or branched alkenyl, O-[(C<sub>1</sub>-C<sub>4</sub>)-straight or branched alkyl], O-benzyl, O-phenyl, 1,2-methylenedioxy, amino, carboxyl, N-[(C<sub>1</sub>-C<sub>5</sub>)-

25 straight or branched alkyl or (C<sub>2</sub>-C<sub>5</sub>)-straight or branched alkenyl]carboxamides, N,N-di[(C<sub>1</sub>-C<sub>5</sub>)-straight or branched alkyl or (C<sub>2</sub>-C<sub>5</sub>)-straight or branched alkenyl]carboxamides, N-morpholinocarboxamide, N-benzylcarboxamide, N-thiomorpholinocarboxamide, N-

30 picolinoylcarboxamide, O-X, CH<sub>2</sub>-(CH<sub>2</sub>)<sub>q</sub>-X, O-(CH<sub>2</sub>)<sub>q</sub>-X, (CH<sub>2</sub>)<sub>q</sub>-O-X, and CH=CH-X;

wherein X is 4-methoxyphenyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, pyrazyl, quinolyl, 3,5-dimethylisoxazolyl, isoxazolyl, 2-methylthiazolyl, thiazolyl,

35 2-thienyl, 3-thienyl, or pyrimidyl; and q is 0-2;

wherein G is U';

wherein M is either oxygen or CH-U'; provided that if G is hydrogen, then M is CH-U' or if M is oxygen, then G is U';

wherein U' is hydrogen, O-[(C1-C4)-straight or branched alkyl] or O-[(C2-C4)-straight or branched alkenyl], (C1-C6)-straight or branched alkyl or (C2-C6)-straight or branched alkenyl, (C5-C7)-cycloalkyl or (C5-  
5 C7)-cycloalkenyl substituted with (C1-C4)-straight or branched alkyl or (C2-C4)-straight or branched alkenyl, [(C1-C4)-alkyl or (C2-C4)-alkenyl]-Y or Y;

wherein Y is selected from the group consisting of phenyl, 1-naphthyl, 2-naphthyl, indenyl, azulenyl,  
10 fluorenyl, anthracenyl, 2-pyrrolinyl, 3-pyrrolinyl, pyrolidinyl, 1,3-dioxolyl, 2-imidazolinyl, imidazolidinyl, 2H-pyranyl, 4H-pyranyl, piperidyl, 1,4-dioxanyl, morpholinyl, 1,4-dithianyl, thiomorpholinyl, piperazinyl, quinuclidinyl, and heterocyclic aromatic  
15 groups as defined for Ar' above;

wherein Y may contain one to three substituents that are independently selected from the group consisting of hydrogen, halogen, hydroxyl, hydroxymethyl, nitro, trifluoromethyl, trifluoromethoxy, (C1-C6)-straight or branched alkyl, (C2-C6)-straight or branched alkenyl, O-  
20 [(C1-C4)-straight or branched alkyl], O-[(C2-C4)-straight or branched alkenyl], O-benzyl, O-phenyl, 1,2-methylenedioxy, amino, and carboxyl;

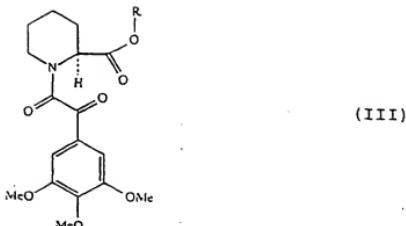

wherein J' is hydrogen, (C1-C2) alkyl or  
25 benzyl; wherein K is (C1-C4)-straight or branched alkyl, benzyl or cyclohexylmethyl, or wherein J' and K may be taken together to form a 5-7 membered heterocyclic ring that may contain a heteroatom selected from the group consisting of O, S, SO and SO<sub>2</sub>;

30 wherein m is 0-3; and

wherein the stereochemistry at position 1 is R or S and the stereochemistry at position 2 is R or S.

(3) Compounds represented by the formula III  
35 (see Armistead et al., Acta Cryst. D51:522-528, 1995, including a discussion of selection of R and of the synthesis of these compounds, the disclosure of which is incorporated herein by reference):

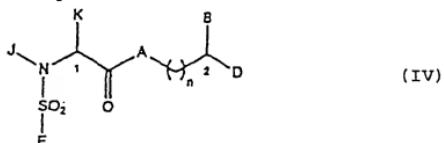

5

(III)

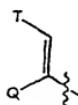

- 10 (4) Compounds represented by the formula IV.  
(see WO 92/21313, including a discussion of the synthesis  
of these compounds, the disclosure of which is  
incorporated herein by reference):

15

- wherein A is CH<sub>2</sub>, oxygen, NH or N-(C<sub>1</sub>-C<sub>4</sub> alkyl);  
20 wherein B and D are independently Ar, hydrogen,  
(C<sub>1</sub>-C<sub>6</sub>)-straight or branched alkyl, (C<sub>1</sub>-C<sub>6</sub>)-straight or  
branched alkenyl, (C<sub>1</sub>-C<sub>6</sub>)-straight or branched alkyl or  
alkenyl that is substituted with a (C<sub>5</sub>-C<sub>7</sub>)-cycloalkyl,  
(C<sub>1</sub>-C<sub>6</sub>)-straight or branched alkyl or alkenyl that is  
25 substituted with a (C<sub>5</sub>-C<sub>7</sub>)-cycloalkenyl, or Ar  
substituted (C<sub>1</sub>-C<sub>6</sub>)-straight or branched alkyl or  
alkenyl, wherein, in each case, one or two of the CH<sub>2</sub>  
groups of the alkyl or alkenyl chains may contain 1-2  
heteroatoms selected from the group consisting of oxygen,  
30 sulfur, SO and SO<sub>2</sub> in chemically reasonable substitution  
patterns, or

35

provided that both B and D are not hydrogen;  
wherein Q is hydrogen, (C<sub>1</sub>-C<sub>6</sub>)-straight or  
branched alkyl or (C<sub>1</sub>-C<sub>6</sub>)-straight or branched alkenyl;

- wherein T is Ar or substituted 5-7 membered cycloalkyl with substituents at positions 3 and 4 that are independently selected from the group consisting of hydrogen, hydroxyl, O-(C1-C4)-alkyl, O-(C1-C4)-alkenyl  
5 and carbonyl;
- wherein Ar is selected from the group consisting of phenyl, 1-naphthyl, 2-naphthyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, monocyclic and bicyclic heterocyclic ring  
10 systems with individual ring sizes being 5 or 6 that may contain in either or both rings a total of 1-4 heteroatoms independently selected from O, N and S; wherein Ar may contain one to three substituents that are independently selected from the group consisting of  
15 hydrogen, halo, hydroxyl, nitro, trifluoromethyl, trifluoromethoxy, (C1-C6)-straight or branched alkyl, (C2-C6)-straight or branched alkenyl, O-(C1-C4)-straight or branched alkyl, O-(C2-C4)-straight or branched alkenyl, O-benzyl, O-phenyl, 1,2-methylenedioxy, amino,  
20 carboxyl and phenyl;

wherein E is (C1-C6)-straight or branched alkyl, (C1-C6)-straight or branched alkenyl, (C5-C7)-cycloalkyl, (C5-C7)-cycloalkenyl substituted with (C1-C4)-straight or branched alkyl or (C1-C4)-straight or  
25 branched alkenyl, [(C2-C4)alkyl or (C2-C4)-alkenyl]-Ar or Ar (Ar as described above);

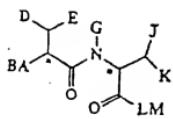

wherein J is hydrogen or C1 or C2 alkyl or benzyl; K is (C1-C4)-straight or branched alkyl, benzyl or cyclohexylmethyl; or wherein J and K may be taken  
30 together to form a 5-7 membered heterocyclic ring that may contain an oxygen, sulfur, SO or SO<sub>2</sub>, substituent therein; and;

wherein n is 0-3; and  
wherein the stereochemistry at position 1 is R  
35 or S and the stereochemistry at position 2 being R or S.

(5) Compounds represented by the formula V  
(see WO 92/04370, including a discussion of the synthesis of these compounds, the disclosure of which is

incorporated herein by reference) :

5

10

wherein A is NH, O, S, or CH;

wherein if A is NH, O, or S, B is PCO- or POCO-, where P is a C1-C6 straight or branched alkyl or alkenyl group, a C5-C6 cycloalkyl or cycloalkenyl, or a 15 methyl substituted with a C5-C6 cycloalkyl, C5-C6 cycloalkenyl, phenyl, 1-naphthyl, 2-naphthyl, 9-fluorenyl, or 1-adamantyl; wherein if A is CH, then B is connected via a trans double bond and is a C2-C4 straight or branched 20 alkyl or alkenyl group, or is a methyl or ethyl substituted with either a C5-C6 cyclic alkyl group or Ar, where Ar is selected from the group consisting of 1-naphthyl, 2-naphthyl, 2-furyl, 3-furyl, 2-thienyl, phenyl and phenyl having one to three substituents that are 25 independently selected from the group consisting of: hydroxyl, halo, nitro, CF<sub>3</sub>, C1-C4 straight or branched alkyl or alkenyl, O-(C1-C4) straight or branched alkyl or alkenyl, and Ar, where Ar is selected from the group consisting of 1-naphthyl, 2-naphthyl, 2-furyl, 3-furyl, 30 2-thienyl, phenyl and phenyl having one to three substituents that are independently selected from the group consisting of: hydroxyl, halo, nitro, CF<sub>3</sub>, C1-C4 straight or branched alkyl or alkenyl, O-(C1-C4) straight or branched alkyl or alkenyl; wherein no more than two Ar 35 groups may be linked together;

wherein D is hydrogen, C1-C4 straight or branched alkyl or alkenyl, hydroxy, tert-butoxy, benzyloxy, 4-benzyloxyphenyl, cyclohexyl, -(CH<sub>2</sub>)<sub>n</sub>-CO<sub>2</sub>-Q, where n=0 or 1 and Q is methyl, ethyl, i-propyl, t-butyl,

- benzyl, 1-naphthyl, 2-naphthyl, or cyclohexyl; or Ar,  
where Ar is selected from the group consisting of 1-  
naphthyl, 2-naphthyl, 2-furyl, 3-furyl, 2-thienyl, phenyl  
and phenyl having one to three substituents that are  
5 independently selected from the group consisting of:  
hydroxyl, halo, nitro, CF<sub>3</sub>, C1-C4 straight or branched  
alkyl or alkenyl, O-(C1-C4) straight or branched alkyl or  
alkenyl, and Ar, where Ar is selected from the group  
consisting of 1-naphthyl, 2-naphthyl, 2-furyl, 3-furyl,  
10 2-thienyl, phenyl and phenyl having one to three  
substituents that are independently selected from the  
group consisting of: hydroxyl, halo, nitro, CF<sub>3</sub>, C1-C4  
straight or branched alkyl or alkenyl, O-(C1-C4) straight  
or branched alkyl or alkenyl; wherein no more than two Ar  
15 groups may be linked together;  
wherein E and K are independently hydrogen or  
methyl;  
wherein G is either methyl or ethyl; J is  
hydrogen, C1-C6 straight or branched alkyl or alkenyl,  
20 C6-C6 cycloalkyl or cycloalkenyl, sulfhydryl, hydroxy,  
phenyl, 3-indolyl, or benzyl; wherein G and J may be  
connected by a bond to form a cycle of 5 or 6 members;  
wherein L is O or an  $\alpha$ -amino acid residue  
attached via the  $\alpha$ -nitrogen, and selected from the group  
25 consisting of: alanine, 2-aminobutyric acid, valine,  
norvaline, leucine, norleucine, isoleucine,  
phenylalanine, cyclohexylalanine, tryptophan, 1-  
naphthylalanine, 2-naphthylalanine, threonine (side chain  
benzyl or tert-butyl ether), methionine, or serine (side  
30 chain benzyl or tert-butyl ether);  
wherein if L is O, then M is C1-C6 straight or  
branched alkyl or alkenyl, or -(CH<sub>2</sub>)<sub>n</sub>-Ar, where n=1-6 and  
Ar is selected from the group consisting of: 1-naphthyl,  
2-naphthyl, 2-furyl, 3-furyl, 2-thienyl, phenyl and  
35 phenyl having one to three substituents that are  
independently selected from the group consisting of:  
hydroxyl, halo, nitro, CF<sub>3</sub>, C1-C4 straight or branched  
alkyl or alkenyl, O-(C1-C4) straight or branched alkyl or  
alkenyl, and Ar, wherein Ar is selected from the group

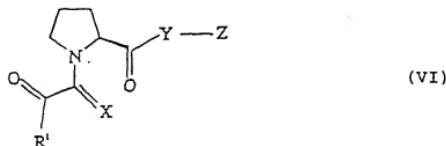

consisting of: 1-naphthyl, 2-naphthyl, 2-furyl, 3-furyl, 2-thienyl, phenyl and phenyl having one to three substituents that are independently selected from the group consisting of: hydroxyl, halo, nitro, CF<sub>3</sub>, Cl-C4 straight or branched alkyl or alkenyl, O-(C1-C4) straight or branched alkyl or alkenyl; wherein no more than two Ar groups may be linked together;

5 wherein if L is an amino acid, then M is O-(C1-C4) straight or branched alkyl, O-benzyl, NH-Phenyl, or  
10 NH-4-nitrophenyl and is attached to the amino acid carbonyl;

15 the stereochemistry at all positions being R or S, and preferably the stereochemistry is S at L if L is an  $\alpha$ -amino acid, and at those positions marked with asterisks; however, when J is sulphydryl, the preferred stereochemistry of the asterisked position immediately adjacent to the nitrogen is R.

(6) Compounds represented by the formula VI  
20 (see WO 96/40633, including a discussion of the synthesis of these compounds, the disclosure of which is incorporated herein by reference):

25

(VI)

30 wherein, R1 is selected from the group consisting of a C1-C9 straight or branched chain alkyl or alkenyl group optionally substituted with C3-C8 cycloalkyl, C3 or C5 cycloalkyl, C5-C7 cycloalkenyl, or Ar1, where said alkyl, alkenyl, cycloalkyl or  
35 cycloalkenyl groups may be optionally substituted with C1-C4 alkyl, C1-C4 alkenyl, or hydroxy, where Ar1 is selected from the group consisting of 1-naphthyl, 2-naphthyl, 2-indolyl, 3-indolyl, 2-furyl, 3-furyl, 2-thiazolyl, 2-thienyl, 3-thienyl, 2-, 3-, 4-pyridyl, and

phenyl, having one to three substituents that are independently selected from the group consisting of hydrogen, halo, hydroxyl, nitro, trifluoromethyl, C1-C6 straight or branched alkyl or alkenyl, C1-C4 alkoxy or 5 C1-C4 alkenyloxy, phenoxy, benzyloxy, and amino; wherein X is selected from the group consisting of oxygen, sulfur, methylene ( $\text{CH}_2$ ), or H<sub>2</sub>; wherein Y is selected from the group consisting of oxygen or NR<sub>2</sub>, where R<sub>2</sub> is hydrogen or C1-C6 alkyl; and 10 wherein Z is selected from the group consisting of C2-C6 straight or branched chain alkyl or alkenyl, wherein the alkyl chain is substituted in one or more positions with Ar<sub>1</sub> as defined above, C3-C8 cycloalkyl, cycloalkyl connected by a C1-C6 straight or unbranched 15 alkyl or alkenyl chain and Ar<sub>2</sub>, where Ar<sub>2</sub> is selected from the group consisting of 2-indolyl, 3-indolyl, 2-furyl, 3-furyl, 2-thiaxolyl, 2-thienyl, 3-thienyl, 2-, 3-, or 4-pyridyl, and phenyl, having one to three substituents that are independently selected from the group consisting 20 of hydrogen, halo, hydroxyl, nitro, trifluoromethyl, C1-C6 straight or branched alkyl or alkenyl, C1-C4 alkoxy or C1-C4 alkenyloxy, phenoxy, benzyloxy, and amino; wherein Z may also be the fragment:

30 where R<sub>3</sub> is selected from the group consisting of straight or branched alkyl C1-C8 optionally substituted with C3-C8 cycloalkyl, or Ar<sub>1</sub> as defined above, and unsubstituted Ar<sub>1</sub>;

35 X<sub>2</sub> is O or NR<sub>5</sub>, where R<sub>5</sub> is selected from the group consisting of hydrogen, C1-C6 straight or branched alkyl and alkenyl;

R<sub>4</sub> is selected from the group consisting of phenyl, benzyl, C1-C5 straight or branched alkyl or

alkenyl, and C1-C5 straight or branched alkyl or alkenyl substituted with phenyl;

wherein the stereochemistry at position 1 is R or S.

5       Also encompassed are pharmaceutically acceptable derivatives of the FK506 analogs, including, but not limited to, any pharmaceutically acceptable salt, ester, salt of an ester, or any other derivative which, upon administration to a patient, is capable of providing  
10 directly or indirectly a non-binding FK506 analog or a metabolite or residue thereof that has the desired neurotrophic activity. Included within the scope of the invention are enantiomers, the racemic form, and diastereoisomeric mixtures. Enantiomers and  
15 diastereoisomers can be separated by conventional methods.

Formulae I-VI above represent compounds that have a wide range of binding affinities for FKBP12. The mechanism for neurotrophic activity of FK506 presented  
20 herein indicates that the effectiveness of FK506 and FK506 analogs in stimulating nerve cell growth is unrelated to their ability to bind FKBP12. Instead, their effectiveness in stimulating nerve cell growth relates to ability of such compounds to bind FKBP52 and  
25 subsequently interfere with the interaction of FKBP52 and hsp90 in a steroid receptor complex, e.g., by competing for FKBP52 binding to hsp90, altering the conformation of FKBP52, etc.

A "non-binding FK506 analog" is defined as an  
30 FK506 analog that does not bind to FKBP12. Preferably, such FK506 analogs bind FKBP12 with an apparent  $K_d$  of greater than 10  $\mu\text{M}$  as measured using well-known assays, and preferably greater than 30  $\mu\text{M}$ , and more preferably greater than 100  $\mu\text{M}$ . Values for the apparent  $K_d$  can be  
35 determined, for example, by a competitive LH-20 binding assay performed as described, for example, in Harding et al., *Nature* 341:758-760, 1989 (using 32-[1- $^{14}\text{C}$ ]-benzoyl FK506 as a reporting ligand; Siekierka et al., *Nature* 341:755-757, 1989, using [ $^3\text{H}$ ]dihydro-FK506 as a reporting

ligand); and U.S. Patent No. 5,654,332.

Alternatively, a "non-binding FK506 analog" is defined as an FK506 analog that does not significantly inhibit FKBP12 rotomase activity when administered to a patient at dosage levels of about 0.01 to about 100 mg/kg body weight/day. Assays for inhibition of FKBP12 rotomase activity are described in Harding et al. (*Nature* 341:758-760, 1989), Siekierka et al., *Nature* 341:755-757, 1989, and U.S. Patent No. 5,654,332, for example. The assays of Harding et al. and Siekierka et al. employ a reaction mixture that includes the *cis* form of N-succinyl-Ala-Ala-Pro-Phe-p-nitroanilide, FKBP12, a test compound, and chymotrypsin, and spectrophotometrically measure the release of p-nitroanilide as a result of isomerization of the substrate.

Non-binding FK506 analogs are non-immunosuppressive, as can be demonstrated by well-known assays, e.g., as discussed in U.S. Patent No. 5,516,797, WO 92/21313, WO 92/19593, and WO 92/04370.

Non-binding FK506 analogs can be used in the form of salts preferably derived from inorganic or organic acids and bases, including, but not limited to: acetate, adipate, alginate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, citrate, 25 camphorate, camphorsulfonate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, fumarate, glucoheptanoate, glycerophosphate, hemisulfate, heptanoate, hexanoate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, lactate, maleate, 30 methanesulfonate, 2-naphthalenesulfonate, nicotinate, oxalate, pamoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, succinate, tartrate, thiocyanate, tosylate, and undecanoate. Base salts include, but are not limited to, 35 ammonium salts, alkali metal salts (such as sodium and potassium salts), alkaline earth metal salts (such as calcium and magnesium salts), salts with organic bases (such as dicyclohexylamine salts), N-methyl-D-glucamine, and salts with amino acids (such as arginine, lysine,

etc.). Basic nitrogen-containing groups can be quaternized, e.g., with such agents as lower alkyl halides (such as methyl, ethyl, propyl; and butyl chlorides, bromides, and iodides), dialkyl sulfates (such as dimethyl, diethyl, dibutyl, and diamyl sulfates), long-chain halides (such as decyl, lauryl, myristyl, and stearyl chlorides, bromides, and iodides), aralkyl halides (such as benzyl and phenethyl bromides), etc. Water or oil-soluble or dispersible products are produced thereby.

Non-binding FK506 analogs can be modified by appending appropriate functionalities by well-known methods to enhance selected biological properties, including increasing penetration of the analogs into a given cellular compartment (e.g., blood, lymphatic system, central nervous system, etc.), increase oral availability, increase solubility to permit administration by injection, alter metabolism, and alter rate of excretion, for example.

Preferably, the non-binding FK506 analogs have a molecular weight below about 750 atomic mass units (a.m.u.) (as the parent compound, although the salts of such compounds can have higher molecular weights).

"Effective amount" or "nerve growth stimulating amount." An "effective amount" or a "nerve growth stimulating amount" of a composition according to the invention is an amount sufficient to achieve a statistically significant promotion of nerve cell growth or regeneration compared to a control. Nerve cell growth or nerve regeneration can be readily assessed using an *in vitro* assay, e.g., the assay described in the Examples below. Alternatively, nerve cell growth or regeneration can be determined in an *in vivo* assay or by direct or indirect signs of nerve cell growth and regeneration in a patient. Preferably, the increase in nerve cell growth or regeneration is at least 10%, preferably at least 30%, and most preferably 50% or more compared to a control. Preferred dosage levels are between about 0.1 to about 400 mg/kg per day of the FK506 analog for subcutaneous

delivery. For oral administration, preferred dosage levels are between about 0.01 to about 40 mg/kg/day.

Therapeutic and Prophylactic Uses

- 5       Pharmaceutical compositions according to the invention can be periodically administered to a mammalian patient (e.g., a human patient), in need of such treatment, to promote neuronal regeneration and functional recovery and to stimulate neurite outgrowth  
10      and thereby to treat various neuropathological states, including damage to peripheral nerves and the central nervous system caused by physical injury (e.g., spinal cord injury and trauma, sciatic or facial nerve lesion or injury), disease (e.g., diabetic neuropathy), cancer  
15      chemotherapy (e.g., by vinca alkaloids and doxorubicin), brain damage associated with stroke and ischemia associated with stroke, and neurological disorders including, but not limited to, various peripheral neuropathic and neurological disorders related to  
20      neurodegeneration including, but not limited to: trigeminal neuralgia, glossopharyngeal neuralgia, Bell's palsy, myasthenia gravis, muscular dystrophy, amyotrophic lateral sclerosis, progressive muscular atrophy, progressive bulbar inherited muscular atrophy, herniated,  
25      ruptured or prolapsed vertebral disk syndromes, cervical spondylosis, plexus disorders, thoracic outlet destruction syndromes, peripheral neuropathies such as those caused by lead, acrylamides, gamma-diketones (glue-sniffer's neuropathy), carbon disulfide, dapsone, ticks,  
30      porphyria, Gullain-Barré syndrome, Alzheimer's disease, Parkinson's disease, and Huntington's chorea.

- In addition, pharmaceutical compositions according to the present invention display a wide range of other therapeutic or prophylactic properties, 35 including, treatment of stroke (see, e.g., Sharkey and Butcher, *Nature* 371:336-339, 1994, Vagita et al., *Life Sciences* 59:1643-1650, 1996; Tokime et al., *Neurosci. Lett.* 206:81-84, 1996; Drake et al., *Acta. Physiol. Scand.* 158:155-159, 1996; and Kuroda et al., *Neurosci.*

*Res. Comm.* 19:83-90, 1996), AIDS dementia (see, e.g., Dawson and Dawson, *Adv. Neuroimmunol.* 4:167-173, 1994; and Sekigawa et al., *J. Clin. Immunol.* 15:312-317, 1995); hair growth (Yamamoto et al., *J. Investig. Dermatol.*

- 5 102:160-164, 1994; Jiang et al., *J. Investig. Dermatol.* 104:523-525, 1995); and connective tissue disorders (see e.g., Steinmann et al., *J. Biol. Chem.* 266:1299-1303, 1991), and as a male contraceptive (see e.g., Hisatomi et al., *Toxicology* 109:75-83, 1996).

10 A transection of a peripheral nerve or a spinal cord injury can be treated by administering a nerve growth stimulating amount of a non-FKBP12-binding nerve growth promoting agent to the mammal and grafting to the peripheral nerve or spinal cord an allograft (Osawa et al., *J. Neurocytol.* 19:833-849, 1990; Buttemeyer et al., *Ann. Plastic Surgery* 35:396-401, 1995) or an artificial nerve graft (Madison and Archibald, *Exp. Neurol.* 128:266-275, 1994; Wells et al., *Exp. Neurol.* 146:395-402, 1997). The space between the transected ends of the peripheral 15 nerve or spinal cord is preferably filled with a non-cellular gap-filling material such as collagen, methyl cellulose, etc., or cell suspensions that promote nerve cell growth, such as Schwann cells (Xu et al., *J. Neurocytol.* 26:1-16, 1997), olfactory cells, and 20 sheathing cells (Li et al. *Science* 277:2000-2002, 1997). The nerve growth promoting agent can be included together 25 with such cellular or non-cellular gap-filling materials.

30 Pharmaceutical Formulations

Pharmaceutical formulations according to the present invention encompass formulations comprising (1) an amount (for example, a unit dosage) of an NGPA together with (2) one or more well-known non-toxic 35 pharmaceutically acceptable excipients, including carriers, diluents, and/or adjuvants, and optionally (3) one or more biologically active ingredients. Standard pharmaceutical formulation techniques are used, such as those disclosed in Remington's *Pharmaceutical*

Sciences, Mack Publishing Co., Easton, PA (latest edition).

A pharmaceutical formulation according to the invention includes one or more NGPAs and can also 5 include, for example, one or more other biologically active ingredients, including, but not limited to FK506 or an FKBP12-binding FK506 analogs or one or more other neurotrophic agents, including, for example, NGF, IGF-1, aFGF, bFGF, PDGF, BDNF, CNTF, GDNF, NT-3, and NT 4/5; and 10 so on.

It is preferred that the pharmaceutical formulation includes an amount of a neurotrophic agent(s), preferably NGF, such that the patient receives a dosage of between about 0.01 to 100 µg/kg body 15 weight/day of the neurotrophic agent, or that the neurotrophic agent be administered separately, e.g., in separate single or multiple dosage forms, preferably concurrently, consecutively, or within less than about five hours of each other.

20 The compositions can be in the form of tablets, capsules, powders, granules, lozenges, liquid or gel preparations, such as oral, topical, or sterile parenteral solutions or suspensions (e.g., eye or ear drops, throat or nasal sprays, etc.), transdermal 25 patches, and other forms known in the art.

Such pharmaceutical compositions can be administered systemically or locally in any manner appropriate to the treatment of a given condition, including orally, parenterally, rectally, nasally, 30 buccally, vaginally, topically, optically, by inhalation spray, or via an implanted reservoir. The term "parenterally" as used herein includes, but is not limited to subcutaneous, intravenous, intramuscular, intrasternal, intrasynovial, intrathecal, intrahepatic, 35 intralesional, and intracranial administration, for example, by injection or infusion. For treatment of the central nervous system, the pharmaceutical compositions preferably readily penetrate the blood-brain barrier when peripherally administered or are administered

intraventricularly.

Pharmaceutically acceptable carriers include, but are not limited to, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins (such as human serum albumin), buffers (such as phosphates), glycine, sorbic acid, potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or electrolytes such as protamine sulfate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, zinc salts, colloidal silica, magnesium trisilicate, polyvinyl pyrrolidone, cellulose-based substances, polyethylene glycol, sodium carboxymethylcellulose, polyacrylates, waxes, polyethylene-polyoxypropylene-block polymers, polyethylene glycol, and wool fat, for example.

Tablets and capsules for oral administration can be in a form suitable for unit dose presentation and can contain conventional pharmaceutically acceptable excipients. Examples of these include binding agents such as syrup, acacia, gelatin, sorbitol, tragacanth, and polyvinylpyrrolidone; fillers such as lactose, sugar, corn starch, calcium phosphate, sorbitol, or glycine; tableting lubricants, such as magnesium stearate, talc, polyethylene glycol, or silica; disintegrants, such as potato starch; and dispersing or wetting agents, such as sodium lauryl sulfate. The tablets can be coated according to methods well known in normal pharmaceutical practice. Oral liquid preparations can be in the form of, for example, aqueous or oily suspensions, solutions, emulsions, syrups or elixirs, or can be presented as a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations can contain conventional additives such as suspending agents, e.g., sorbitol, syrup, methyl cellulose, glucose syrup, gelatin, hydrogenated edible fats, emulsifying agents, e.g., lecithin, sorbitan monoleate, or acacia; non-aqueous vehicles (including edible oils), e.g., almond oil, fractionated coconut oil, oily esters such as glycerine, propylene glycol, or ethyl alcohol; preservatives such as methyl or propyl p-hydroxybenzoate

or sorbic acid, and, if desired, conventional flavoring or coloring agents.

Pharmaceutical compositions according to the present invention can also be administered parenterally 5 in a sterile aqueous or oleaginous medium. The composition can be dissolved or suspended in a non-toxic parenterally-acceptable diluent or solvent, e.g., as a solution in 1,3-butanediol. Adjuvants such as local anesthetics, preservatives, and buffering agents can also 10 be dissolved in the vehicle. Commonly used vehicles and solvents include water, physiological saline, Hank's solution, Ringer's solution, and sterile, fixed oils, including synthetic mono- or di-glycerides, etc. Fatty acids, such as oleic acid and its glyceride derivatives 15 are useful in the preparation of injectables, as are natural pharmaceutically acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant, such 20 as Ph. Helv or a similar alcohol.

For topical application, the drug may be made up into a solution, suspension, cream, lotion, ointment in a suitable aqueous or non-aqueous vehicle. Additives may also be included, e.g., buffers such as sodium 25 metabisulphite or disodium edeate; preservatives such as bactericidal and fungicidal agents, including phenyl mercuric acetate or nitrate, benzalkonium chloride or chlorhexidine, and thickening agents, such as hypromellose.

The dosage unit involved depends, for example, 30 on the condition treated, nature of the formulation, nature of the condition, embodiment of the claimed pharmaceutical compositions, mode of administration, and condition and weight of the patient. Dosage levels on 35 the order of about 0.1 to about 400 mg/kg per day of the active ingredient are useful in the treatment of the conditions listed above.

The invention will be better understood by reference to the following examples, which are intended

to merely illustrate the best mode now known for practicing the invention. The scope of the invention is not to be considered limited thereto, however.

5

EXAMPLES

FK506 and Geldanamycin Promote Nerve Regeneration by a Common Mechanism

Materials and Methods

10       Cell cultures. SH-SY5Y human neuroblastoma cells were maintained in DMEM medium (GIBCO) supplemented with 10% fetal calf serum (SIGMA), 50 IU/mL penicillin, and 50 mg/mL streptomycin (GIBCO) at 37°C in 7% CO<sub>2</sub>. Cells were plated in six-well plates at 1 x 10<sup>6</sup> cells/well

15 and treated with 0.4 mM aphidicolin (SIGMA). At five days, cells were washed, treated with nerve growth factor (NGF) (Boehringer Mannheim, Indianapolis, IN) at 10 ng/mL (to induce process outgrowth) in the presence or absence of FK506 (1 and 10 nM) (Calbiochem-Novabiochem Int'l., La Jolla, CA) and/or geldanamycin (0.1, 1, and 10 nM) (Calbiochem-Novabiochem, La Jolla, CA). Media was changed at 96 hours and replaced with fresh media with the compounds (NGF plus FK506 and/or geldanamycin) for an additional 72 hours (total time, 168 hours). The top 50%

20 of axonal lengths were selected for statistical analysis. All experiments were run in duplicate wells and repeated at least twice for reproducibility.

25       Light morphometry of neurite lengths. For analysis of process length, cells 20 fields per well) were randomly photographed at 72 and 168 hours. Neurite lengths were measured on photographic prints using a Houston Instrument HI-PAD digitizing tablet connected to an IBM XT computer with appropriate software (Bioquant IV, R&M Biometrics, Nashville, TN); only those processes greater than two times the cell body length were measured. Data from identically treated wells were not different and were therefore combined. Mean values and histograms were constructed from these data. Histograms were compared using a Mann-Whitney U test, which makes no

assumptions about the shape of the distribution.

Preparation of FK506 and geldanamycin. FK506 (mol. wt. 822) and geldanamycin (mol. wt. 561) were dissolved in DMEM medium.

5

Results

In a first set of experiments, SH-SY5Y neuroblastoma cells were plated in 6-well plates with DMEM plus 15% FCS and differentiated with NGF (10 ng/ml).

- 10 The effects of various concentrations of geldanamycin and FK506 on neurite growth, alone and in combination, were tested. The mean lengths of neuritic processes of untreated and treated cells are shown in Table 1.

The cells developed long axonal-like processes upon exposure to NGF (10 ng/mL) as measured at 168 hours after treatment. NGF more than doubled the mean length of the processes compared to untreated cells (compare FIGS. 1 and 2). An even greater increase in the length of the processes was observed when the cells were exposed 15 to geldanamycin at 1 nM in the presence of NGF (FIG. 3). However, geldanamycin at 10 nM had no effect (FIG. 4). FK506 (10 nM) stimulated neurite outgrowth in the presence of NGF (FIG. 5) to a greater degree than geldanamycin at either 1 nM or 10 nM. In combination 20 with FK506 (10 nM), geldanamycin (FIG. 6, 1 nM; FIG. 7, 10 nM) inhibited the effect of FK506 in a concentration-dependent fashion.

In a second set of experiments, lower concentrations of geldanamycin and FK506 were tested, 25 alone and in combination. The mean lengths of neuritic processes of untreated and treated cells are shown in Table 2. NGF-treated cells (FIG. 9) had mean neuritic lengths more than double the mean length of untreated control cells (FIG. 8). Nerve growth stimulation was observed with FK506 (1 nM, FIG. 10; 10 nM, FIG. 11) in the presence of NGF and geldanamycin (0.1 nM, FIG. 12) in the presence of NGF. The lower concentration of FK506 (1 nM) was more effective in stimulating neurite outgrowth than the higher concentration (10 nM), and geldanamycin

at 0.1 nM was even more effective in stimulating neurite outgrowth than FK506 at either 1 nM or 10 nM. Combined treatment with geldanamycin (0.1 nM) and FK506 (1 nM, FIG. 13; 10 nM, FIG. 14) in the presence of NGF showed  
5 that the effects of geldanamycin and FK506 were additive, particularly at the lower FK506 concentration (FIG. 13).

Geldanamycin and FK506 each stimulate neurite outgrowth in a concentration-dependent fashion. Taken together, the similar effects of geldanamycin and FK506  
10 in stimulating neurite outgrowth, their additive effects at low concentrations, and their inhibitory effects at high concentrations (like high concentrations of either compound alone), demonstrate that the two compounds act on nerve cells via a common mechanism. That mechanism  
15 likely involves an interaction of both compounds with components of steroid receptor complexes. FKBPI2 does not appear to play a role in the stimulation of neurite outgrowth by either geldanamycin or FK506.

In further experiments, we have found that  
20 estrogen (10 nM) and dexamethasone (10 nM) increased neurite outgrowth (without NGF) of SH-SY5Y cells and produced an additive effect on neurite outgrowth (neurotrophic action) with FK506 (10 nM).

This invention has been detailed both by  
25 example and by direct description. It should be apparent that one having ordinary skill in the relevant art would be able to surmise equivalents to the invention as described in the claims which follow but which would be within the spirit of the foregoing description. Those  
30 equivalents are to be included within the scope of this invention.

TABLE 1: Mean Length of Top 50% of Neuritic Processes of SH-SY5Y 168 Hours After Treatment with Geldanamycin (1 nM or 10 nM) and/or FK506 (10 nM) in the Presence of NGF

	<u>Treatment</u>	<u>Mean Length (μM)</u>	<u>S.E.M.</u>
5	Untreated	41.61	1.25
10	NGF (10 ng/mL)	53.99	2.26
10	Geldanamycin (1 nM) + NGF (10 ng/mL)	64.00	2.36
15	Geldanamycin (10 nM) + NGF (10 ng/mL)	54.81	2.10
15	FK506 (10 nM) + NGF (10 ng/mL)	77.82	2.70
20	Geldanamycin (1 nM) + FK506 (10 nM) + NGF (10 ng/mL)	72.63	2.01
25	Geldanamycin (10 nM) + FK506 (10 nM) + NGF (10 ng/mL)	67.41	1.67

TABLE 2: Mean Length of Top 50% of Neuritic Processes of SH-SY5Y 168 Hours After Treatment with Geldanamycin (0.1 nM) and/or FK506 (1 nM or 10 nM) in the Presence of NGF

	<u>Treatment</u>	<u>Mean Length (μM)</u>	<u>S.E.M.</u>
35	Untreated	31.86	1.56
	NGF (10 ng/mL)	70.38	6.61
40	Geldanamycin (0.1 nM) + NGF (10 ng/mL)	98.07	5.72
	FK506 (1 nM) + NGF (10 ng/mL)	89.92	6.40
45	FK506 (10 nM) + NGF (10 ng/mL)	82.68	5.22
50	Geldanamycin (0.1 nM) + FK506 (1 nM) + NGF (10 ng/mL)	110.51	6.13
	Geldanamycin (0.1 nM) + FK506 (10 nM) + NGF (10 ng/mL)	92.50	6.40
